Graph Sketching

Step 1. Find any points at which the graph cuts the coordinate axes.

Graph Sketching

Step 1. Find any points at which the graph cuts the coordinate axes.

Step 2. Find any stationary points where $f'(x) = 0$.

Graph Sketching

Step 1. Find any points at which the graph cuts the coordinate axes.

Step 2. Find any stationary points where $f'(x) = 0$.

Step 3. Find any vertical asymptotes (denominator zero?)

Graph Sketching

Step 1. Find any points at which the graph cuts the coordinate axes.

Step 2. Find any stationary points where $f'(x) = 0$.

Step 3. Find any vertical asymptotes (denominator zero?)

Step 4. Consider the behaviour of the graph for numerically large x, giving the equation of any horizontal or oblique asymptotes.

Graph Sketching

Step 1. Find any points at which the graph cuts the coordinate axes.

Step 2. Find any stationary points where $f'(x) = 0$.

Step 3. Find any vertical asymptotes (denominator zero?)

Step 4. Consider the behaviour of the graph for numerically large x, giving the equation of any horizontal or oblique asymptotes.

Step 5. Complete the sketch.

Graph Sketching - Asymptotes

Step 4. Consider the behaviour of the graph for numerically large x, giving the equation of any horizontal or oblique asymptotes.

Graph Sketching - Asymptotes

Step 4. Consider the behaviour of the graph for numerically large x, giving the equation of any horizontal or oblique asymptotes.

- If the degree of the denominator is greater than the degree of the numerator, then $y \to 0$ as $x \to \pm\infty$. This means that there is a horizontal asymptote at $y = 0$.

Graph Sketching - Asymptotes

Step 4. Consider the behaviour of the graph for numerically large x, giving the equation of any horizontal or oblique asymptotes.

- If the degree of the denominator is greater than the degree of the numerator, then $y \to 0$ as $x \to \pm\infty$. This means that there is a horizontal asymptote at $y = 0$.
  - $$f(x) = \frac{1}{x} \tag{1}$$

Graph Sketching - Asymptotes

Step 4. Consider the behaviour of the graph for numerically large x, giving the equation of any horizontal or oblique asymptotes.

- If the degree of the denominator is greater than the degree of the numerator, then $y \to 0$ as $x \to \pm\infty$. This means that there is a horizontal asymptote at $y = 0$.
  - $$f(x) = \frac{1}{x} \tag{1}$$
  - $$f(x) = \frac{x}{x^2 + 2} \tag{2}$$

Graph Sketching - Asymptotes

Step 4. Consider the behaviour of the graph for numerically large x, giving the equation of any horizontal or oblique asymptotes.

- If the degree of the denominator is greater than the degree of the numerator, then $y \to 0$ as $x \to \pm\infty$. This means that there is a horizontal asymptote at $y = 0$.
  - $$f(x) = \frac{1}{x} \tag{1}$$
  - $$f(x) = \frac{x}{x^2 + 2} \tag{2}$$
  - $$f(x) = \frac{1}{x(x^2 + 1)} \tag{3}$$

Graph Sketching - Asymptotes

Step 4. Consider the behaviour of the graph for numerically large x, giving the equation of any horizontal or oblique asymptotes.

- If the degree of the denominator is greater than the degree of the numerator, then $y \to 0$ as $x \to \pm\infty$. This means that there is a horizontal asymptote at $y = 0$.
  - $$f(x) = \frac{1}{x} \tag{1}$$
  - $$f(x) = \frac{x}{x^2 + 2} \tag{2}$$
  - $$f(x) = \frac{1}{x(x^2 + 1)} \tag{3}$$
  - $$f(x) = \frac{5 - 3x}{(x - 1)(x - 3)} \tag{4}$$

Graph Sketching - Asymptotes

Step 4. Consider the behaviour of the graph for numerically large x, giving the equation of any horizontal or oblique asymptotes.

- If the degree of the denominator is greater than the degree of the numerator, then $y \to 0$ as $x \to \pm\infty$. This means that there is a horizontal asymptote at $y = 0$.
  - $$f(x) = \frac{1}{x} \tag{1}$$
  - $$f(x) = \frac{x}{x^2 + 2} \tag{2}$$
  - $$f(x) = \frac{1}{x(x^2 + 1)} \tag{3}$$
  - $$f(x) = \frac{5 - 3x}{(x - 1)(x - 3)} \tag{4}$$
  - $$f(x) = \frac{x}{(x - 1)^2} \tag{5}$$

Graph Sketching - Asymptotes

Step 4. Consider the behaviour of the graph for numerically large x, giving the equation of any horizontal or oblique asymptotes.

- If the degree of the denominator is equal to the degree of the numerator, then there is a horizontal asymptote other than the x-axis. You can find this asymptote by dividing out.

Graph Sketching - Asymptotes

Step 4. Consider the behaviour of the graph for numerically large x, giving the equation of any horizontal or oblique asymptotes.

- If the degree of the denominator is equal to the degree of the numerator, then there is a horizontal asymptote other than the x-axis. You can find this asymptote by dividing out.
  -

$$f(x) = \frac{(x+1)^2}{(x-1)(x-2)}$$

Graph Sketching - Asymptotes

Step 4. Consider the behaviour of the graph for numerically large x, giving the equation of any horizontal or oblique asymptotes.

- If the degree of the denominator is equal to the degree of the the numerator, then there is a horizontal asymptote other than the x-axis. You can find this asymptote by dividing out.
  - $$f(x) = \frac{(x+1)^2}{(x-1)(x-2)} = 1 - \frac{4}{x-1} + \frac{9}{x-2}$$

Graph Sketching - Asymptotes

Step 4. Consider the behaviour of the graph for numerically large x, giving the equation of any horizontal or oblique asymptotes.

- If the degree of the denominator is equal to the degree of the numerator, then there is a horizontal asymptote other than the x-axis. You can find this asymptote by dividing out.
  - $$f(x) = \frac{(x+1)^2}{(x-1)(x-2)} = 1 - \frac{4}{x-1} + \frac{9}{x-2}$$
    $\implies$ Horizontal asymptote at $y = 1$

Graph Sketching - Asymptotes

Step 4. Consider the behaviour of the graph for numerically large x, giving the equation of any horizontal or oblique asymptotes.

- If the degree of the denominator is equal to the degree of the numerator, then there is a horizontal asymptote other than the x-axis. You can find this asymptote by dividing out.
  - $$f(x) = \frac{(x+1)^2}{(x-1)(x-2)} = 1 - \frac{4}{x-1} + \frac{9}{x-2}$$
    $$\implies \text{Horizontal asymptote at } y = 1$$
  - $$f(x) = \frac{5-3x}{x-3}$$

Graph Sketching - Asymptotes

Step 4. Consider the behaviour of the graph for numerically large x, giving the equation of any horizontal or oblique asymptotes.

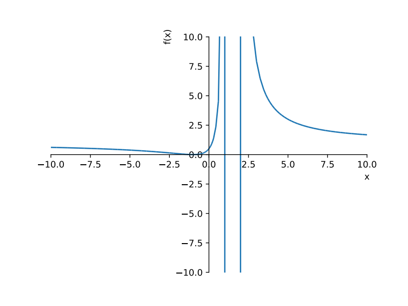
- If the degree of the denominator is equal to the degree of the numerator, then there is a horizontal asymptote other than the x-axis. You can find this asymptote by dividing out.
  - $$f(x) = \frac{(x+1)^2}{(x-1)(x-2)} = 1 - \frac{4}{x-1} + \frac{9}{x-2}$$
    $$\implies \text{Horizontal asymptote at } y = 1$$
  - $$f(x) = \frac{5-3x}{x-3} = -3 - \frac{4}{x-3}$$

Graph Sketching - Asymptotes

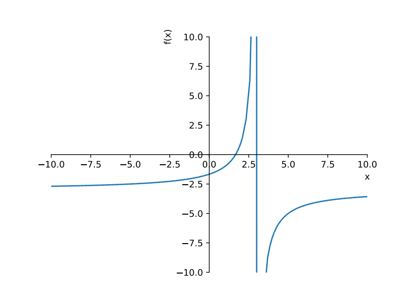
Step 4. Consider the behaviour of the graph for numerically large x, giving the equation of any horizontal or oblique asymptotes.

- If the degree of the denominator is equal to the degree of the numerator, then there is a horizontal asymptote other than the x-axis. You can find this asymptote by dividing out.
  - $$f(x) = \frac{(x+1)^2}{(x-1)(x-2)} = 1 - \frac{4}{x-1} + \frac{9}{x-2}$$
    $$\implies \text{Horizontal asymptote at } y = 1$$
  - $$f(x) = \frac{5-3x}{x-3} = -3 - \frac{4}{x-3}$$
    $$\implies \text{Horizontal asymptote at } y = -3$$

Graph Sketching - Asymptotes



$$y = 1 - \frac{4}{x-1} + \frac{9}{x-2}$$



$$y = -3 - \frac{4}{x-3}$$

Graph Sketching - Asymptotes

Step 4. Consider the behaviour of the graph for numerically large x, giving the equation of any horizontal or oblique asymptotes.

- If the degree of the denominator is one less than the degree of the numerator, then there is an oblique asymptote. You can find this asymptote by dividing out.

Graph Sketching - Asymptotes

Step 4. Consider the behaviour of the graph for numerically large x, giving the equation of any horizontal or oblique asymptotes.

- If the degree of the denominator is one less than the degree of the numerator, then there is an oblique asymptote. You can find this asymptote by dividing out.
    -

$$f(x) = \frac{x^2 + 4}{x}$$

Graph Sketching - Asymptotes

Step 4. Consider the behaviour of the graph for numerically large x, giving the equation of any horizontal or oblique asymptotes.

- If the degree of the denominator is one less than the degree of the numerator, then there is an oblique asymptote. You can find this asymptote by dividing out.
  -
    $$f(x) = \frac{x^2+4}{x} = x + \frac{4}{x}$$

Graph Sketching - Asymptotes

Step 4. Consider the behaviour of the graph for numerically large x, giving the equation of any horizontal or oblique asymptotes.

- If the degree of the denominator is one less than the degree of the numerator, then there is an oblique asymptote. You can find this asymptote by dividing out.
  -

$$f(x) = \frac{x^2+4}{x} = x + \frac{4}{x}$$
$$\implies \text{Oblique asymptote is } y = x$$

Graph Sketching - Asymptotes

Step 4. Consider the behaviour of the graph for numerically large x, giving the equation of any horizontal or oblique asymptotes.

- If the degree of the denominator is one less than the degree of the numerator, then there is an oblique asymptote. You can find this asymptote by dividing out.
    - $$f(x) = \frac{x^2+4}{x} = x + \frac{4}{x}$$
      $$\implies \text{Oblique asymptote is } y = x$$
    - $$f(x) = \frac{x(x+3)}{x-1}$$

Graph Sketching - Asymptotes

Step 4. Consider the behaviour of the graph for numerically large x, giving the equation of any horizontal or oblique asymptotes.

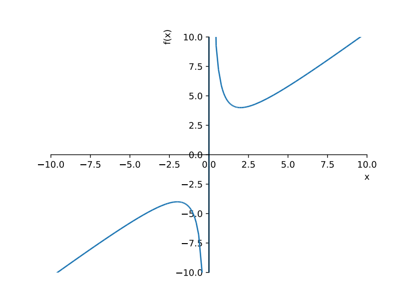
- If the degree of the denominator is one less than the degree of the numerator, then there is an oblique asymptote. You can find this asymptote by dividing out.
  - $$f(x) = \frac{x^2+4}{x} = x + \frac{4}{x}$$
    $$\implies \text{Oblique asymptote is } y = x$$
  - $$f(x) = \frac{x(x+3)}{x-1} = x + 4 + \frac{4}{x-1}$$

Graph Sketching - Asymptotes

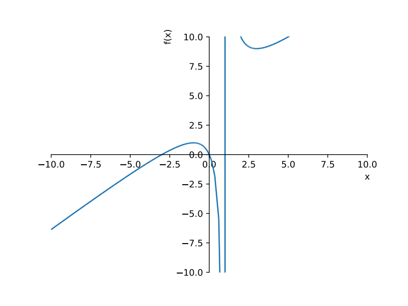
Step 4. Consider the behaviour of the graph for numerically large x, giving the equation of any horizontal or oblique asymptotes.

- If the degree of the denominator is one less than the degree of the numerator, then there is an oblique asymptote. You can find this asymptote by dividing out.
  - $$f(x) = \frac{x^2+4}{x} = x + \frac{4}{x}$$
    $$\implies \text{Oblique asymptote is } y = x$$
  - $$f(x) = \frac{x(x+3)}{x-1} = x + 4 + \frac{4}{x-1}$$
    $$\implies \text{Oblique asymptote is } y = x + 4$$

Graph Sketching - Asymptotes



$y = x + \frac{4}{x}$



$y = x + 4 + \frac{4}{x-1}$

Things to Remember

- Points at which the graph cuts the coordinate axes.

Things to Remember

- Points at which the graph cuts the coordinate axes.
- Stationary points where $f'(x) = 0$.

Things to Remember

- Points at which the graph cuts the coordinate axes.
- Stationary points where $f'(x) = 0$.
- Vertical asymptotes (may be more than one!)

Things to Remember

- Points at which the graph cuts the coordinate axes.
- Stationary points where $f'(x) = 0$.
- Vertical asymptotes (may be more than one!)
- Horizontal and oblique asymptotes.

Stationary Points

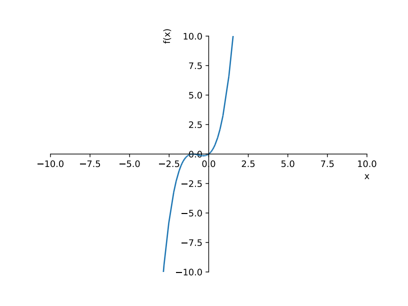
- We know that stationary points occur when $f'(x) = 0$.

Stationary Points

- We know that stationary points occur when $f'(x) = 0$.
- But how do we know if these points local maxima/minima?

Stationary Points

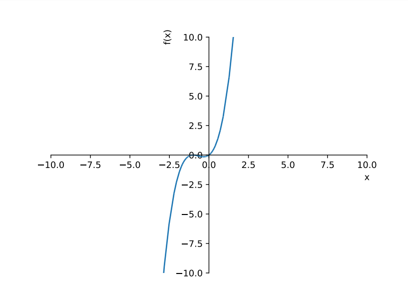
- We know that stationary points occur when $f'(x) = 0$.
- But how do we know if these points local maxima/minima?



$$f(x) = x^3 + 2x^2 + x$$

Stationary Points

- We know that stationary points occur when $f'(x) = 0$.
- But how do we know if these points local maxima/minima?

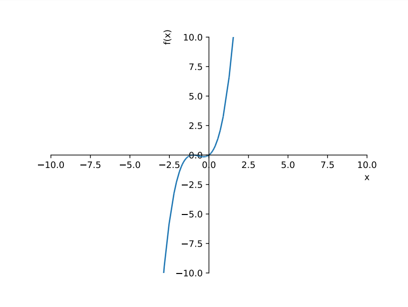


$$f(x) = x^3 + 2x^2 + x$$

Second derivative test:

Stationary Points

- We know that stationary points occur when $f'(x) = 0$.
- But how do we know if these points local maxima/minima?



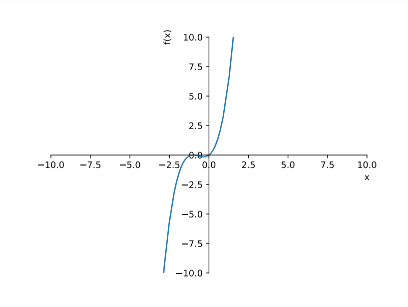
$$f(x) = x^3 + 2x^2 + x$$

Second derivative test:

- If $f''(x) < 0$, the stationary point at x is concave down; **a maximum**.

Stationary Points

- We know that stationary points occur when $f'(x) = 0$.
- But how do we know if these points local maxima/minima?



$$f(x) = x^3 + 2x^2 + x$$

Second derivative test:

- If $f''(x) < 0$, the stationary point at x is concave down; **a maximum**.
- If $f''(x) > 0$, the stationary point at x is concave up; **a minimum**.

Other Properties of Graphs - Odd & Even

- An **even** function is one such that

$$f(x) = f(-x) \tag{6}$$

Other Properties of Graphs - Odd & Even

- An **even** function is one such that

$$f(x) = f(-x) \tag{6}$$

- An **odd** function is one such that

$$f(x) = -f(-x) \tag{7}$$

Other Properties of Graphs - Odd & Even

- An **even** function is one such that

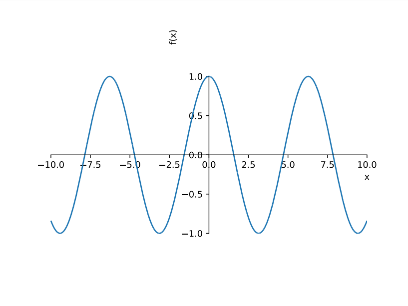
$$f(x) = f(-x) \tag{6}$$

- An **odd** function is one such that

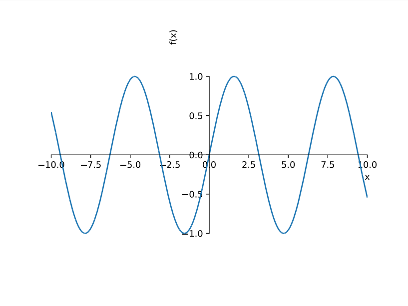
$$f(x) = -f(-x) \tag{7}$$

- Can you think of any examples of odd and even functions?

Other Properties of Graphs - Odd & Even



$f(x) = cos(x)$



$f(x) = sin(x)$

Other Properties of Graphs - Image and Inverse Image

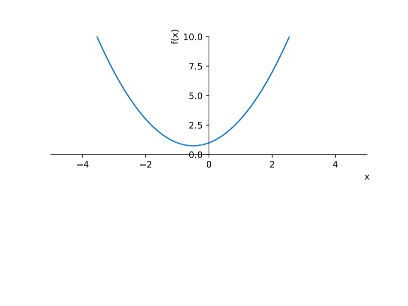
- The **image** of a set under a function is the set of values which that function maps the element of the set to. Consider

$$f(x) = x^2 + x + 1 \quad \text{for} \quad x \in [-2, 1] \tag{8}$$

Other Properties of Graphs - Image and Inverse Image

- The **image** of a set under a function is the set of values which that function maps the element of the set to. Consider

$$f(x) = x^2 + x + 1 \quad \text{for} \quad x \in [-2, 1] \tag{8}$$

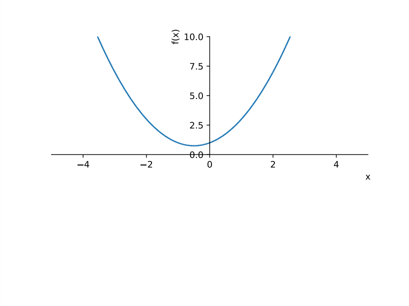


$f(x) = x^2 + x + 1$

Other Properties of Graphs - Image and Inverse Image

- The **image** of a set under a function is the set of values which that function maps the element of the set to. Consider

$$f(x) = x^2 + x + 1 \quad \text{for} \quad x \in [-2, 1] \tag{8}$$



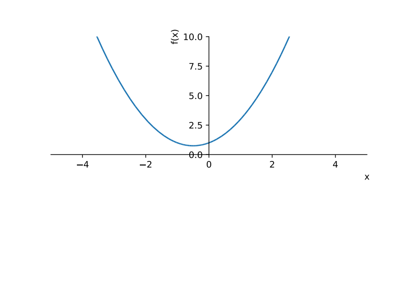
$f(x) = x^2 + x + 1$

- The **image** of the set $[-2, 1]$ is the part of the y-axis enclosed by the function in this x-range.

Other Properties of Graphs - Image and Inverse Image

- The **image** of a set under a function is the set of values which that function maps the element of the set to. Consider

$$f(x) = x^2 + x + 1 \quad \text{for} \quad x \in [-2, 1] \tag{8}$$



$f(x) = x^2 + x + 1$

- The **image** of the set $[-2, 1]$ is the part of the y-axis enclosed by the function in this x-range.
- In this case, $f([-2, 1]) = \left[\frac{3}{4}, 3\right]$
